# Shear Force and Shear Stress

Shear force is an internal force present at a cut section.

The shear force, V, is the force graphed in a Shear Diagram, and related to the moment.

Shear stress is that force distributed across the section of the beam. Just like flexure stress, this distribution is not uniform across the section.

In observing an FBD of an elemental square, notice that both horizontal and vertical shear stresses are present.

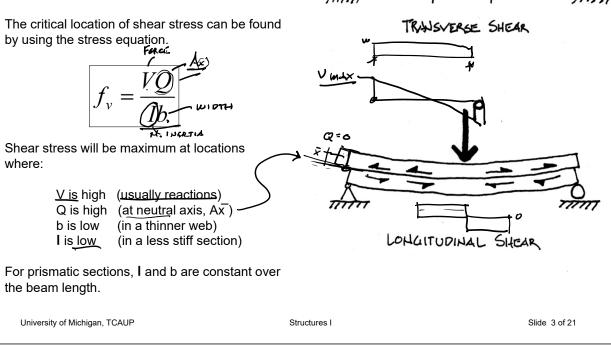

## **Shear Direction**

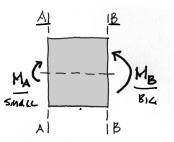

At any particular point in the beam, both horizontal and vertical shear stress are equal.

Depending on the material, either horizontal or vertical shear may be critical.

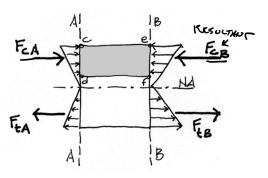

## **Critical Shear Location**

# Shearing Unit Stress in Beams Considering shear and moment in a beam: $\begin{array}{c} & & \\ &$

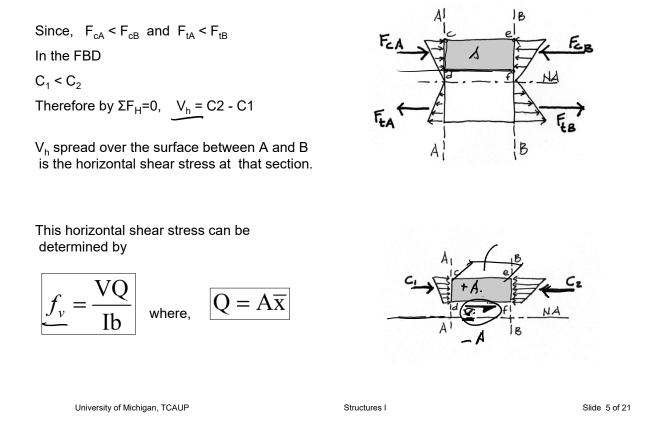

Taking a beam section between points A and B, the moment  $M_A < M_B$ 

Therefore,  $F_{cA} < F_{cB}$  and  $F_{tA} < F_{tB}$ 

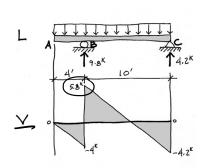

M

# Shearing Unit Stress in Beams (cont.)

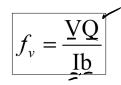

# Shear Stress Analysis Procedure

- 1. Draw the shear diagram and find  $V_{max}$ .
- 2. Determine least width,  $b_{min}$ .
- 3. Calculate I.
- 4. Calculate Q for the section.  $Q_{max}$  at <u>N.A.</u>
- 5. Calculate  $f_v = VQ/Ib$ .

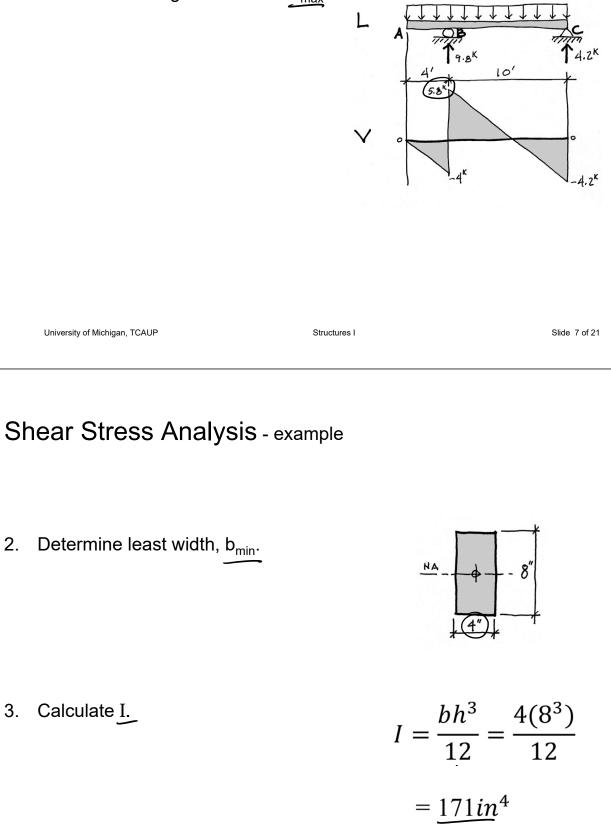

# Shear Stress Analysis - example

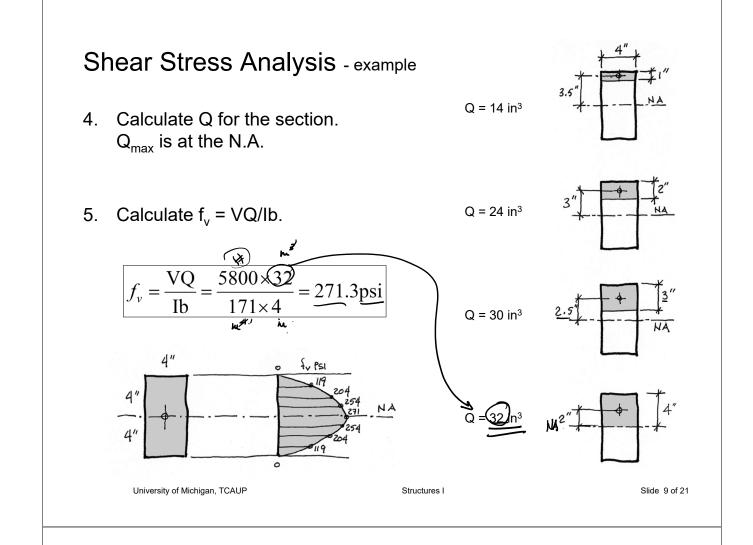

Find the maximum shear stress

University of Michigan, TCAUP

Draw the shear diagram and find  $V_{max}$ . 1.

3. Calculate I.

#### Shear Stress in Common Shapes

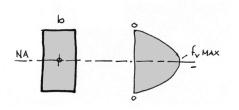

The shear distribution in 3 common profiles is shown at the right.

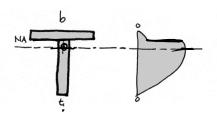

Notice that if b is constant or thin at the centroidal axis, then the maximum shear occurs there. This is usually the case.

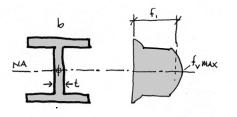

If, however, the section is wider at the centroidal axis, the maximum stress may be located at a level where the section is thinner.

Abrupt changes in width, result in abrupt changes in stress level.

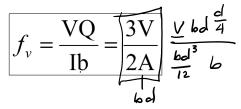

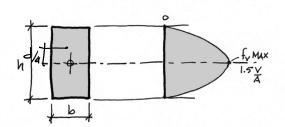

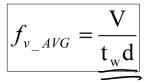

#### Shear in Common Shapes

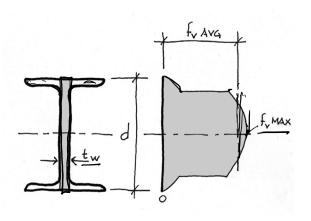

For common shapes some special formulas are used. In **rectangles**, inserting b and h into the equations of I and Q will give:

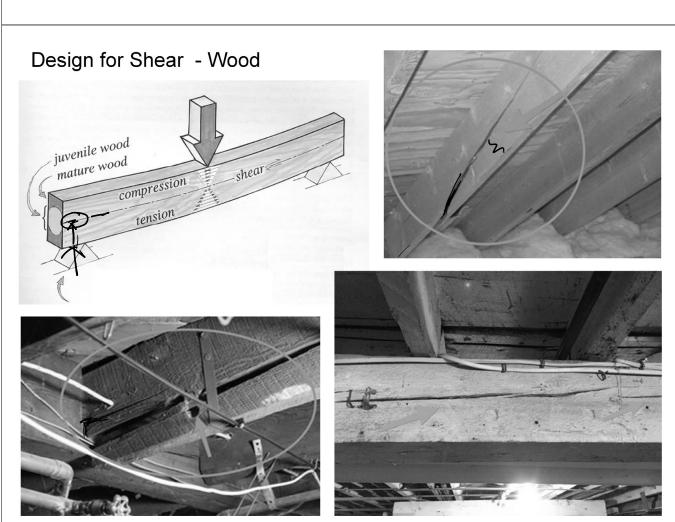

In **W**, **C** and **I** sections, because the average shear stress is just a bit less than the actual maximum, but much easier to calculate, the average is used:

#### **Design of Shear Connectors**

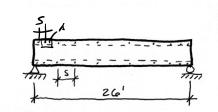

The connections at the planes of contact of any built-up section must be able to transmit the shear stress across that plane.

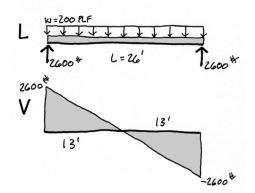

The following example shows a box-beam section which uses nails to connect the plywood sides to the 2x4 top & bottom plates.

Because the shear force, V, varies linearly across the length of the beam, the spacing of the nails can also vary for increased economy.

Structures I

Slide 17 of 21

#### **Design of Shear Connectors**

Q is based on the area which 'slides' in relation to the beam (area above the cut). In this case the 2x4 (actually 1.5x3.5) is the area which 'slides' in relation to the plywood sides. The stress which is determined, can be seen as acting on the contact surface of the shear planes. b is the distance across the shearing surface. With 2 shear planes the surface area is doubled (b = 1.5" x 2).

$$f_{v} = \frac{VQ}{Ib}$$

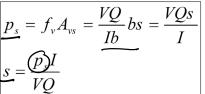

$$V_{max} = 2600 \#$$

$$I = 1202.6in^{4}$$

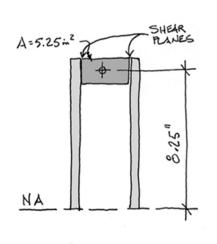

$$Q = A\overline{x} = (3.5in \times 1.5in) 8.25in = 43.3in^{3}$$

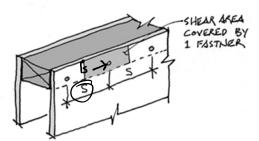

$$b = 1.5in \times (2sides)$$

The force on the shear plane is P =  $f_v A_v$ , where  $A_v$  is the shear surface area. To find the force on a pair of nails ( $p_s$ ) use the area surrounding those 2 nails (1/2 distance to adjacent nails times b).

Design of Shear Connectors

$$s = \frac{p_s I}{VQ} = \frac{80\#(2)(1202.6 \text{ in}^4)}{2600\#(43.3 \text{ in}^3)} = 1.71 \text{ in}$$
  

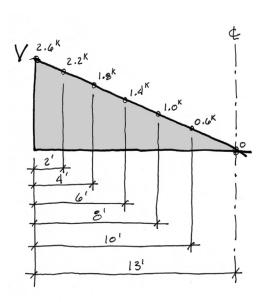

$$\therefore \text{ use } 1.5"$$

This gives the spacing at the ends where the V=2600#. At other locations along the beam, the spacing can be found by substituting the appropriate V into the equation above. Usually, the increment, s, is rounded to the nearest half inch.

A total number of nails can be found based on the average force V<sub>avg</sub> to get an average spacing, s<sub>avg</sub>, and then dividing the total length by s<sub>avg</sub>.

$$s_{avg} = \frac{p_s I}{V_{avg} Q} = \frac{80\#(2) (1202.6 \text{ in}^4)}{1300\#(43.3 \text{ in}^3)} = 3.42 \text{ in}$$

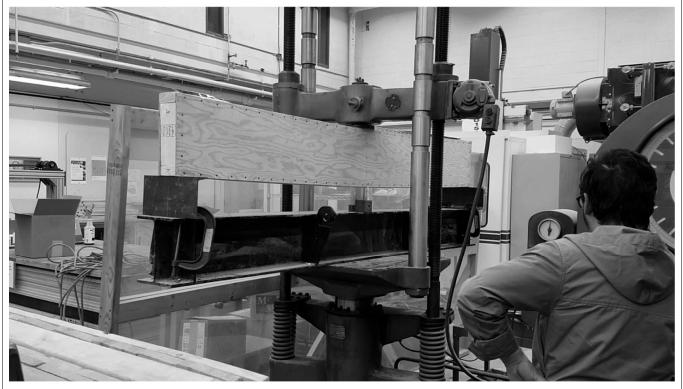

$$N_{total} \text{ per side} = \frac{L}{s_{avg}} = \frac{26 \text{ ft}}{3.42 \text{ in}} \frac{12 \text{ in}}{\text{ft}} = 91.27 \text{ nails}$$
∴ use 92 nails/side

0.C. S	V lbs.	from end
1.5″	2963	<u>0</u>
2″	2222	1'-11"
4"	1111	7'-5"
6"	741	<u>9</u> '-4"
