Cables

Both the sag and the load determine the force in the cable.

The less the sag, the higher the force in the cable.

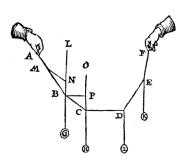

The vertical component of the cable force in the case shown remains constant . Ty=P/2 But since the resultant follows the direction of the cable, Tx becomes greater as sag decreases. With no sag, Tx is infinite!

Catenary Shapes

The shape of the catenary depends on the loading. Simon Stevin showed this experimentally in 1585 with a weighted cord.

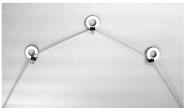

Because the cord has no resistance to moment, it assumes the shape (reversed) of the moment diagram for a beam with the same loading.

Cable Bridges

Long span bridges are often cable supported.

There are 3 common types:

- · earth anchored cable
- · deck anchored cable
- · cable stayed

Solving Cables Forces

even supports – symmetric loading Procedure:

- 1. Solve all external forces (reactions)
- If symmetric, then the reactions at each end are equal
- Use 3 equilibrium equations to solve

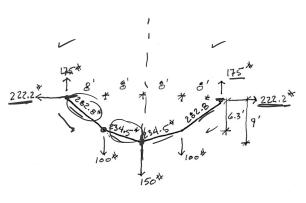

$$\sum Fx = 0 \quad \sum Fy = 0 \quad \sum M = 0$$

 The moment is also 0 at any point in the cable since the cable cannot support flexure,

- Draw FBD of system from reaction inward
- · Slope is proportional to forces
- · Use force equations to solve at cut
- Find forces and slope of each section

$$\sum Fx = 0$$
$$\sum Fy = 0$$

Slide 5 of 21

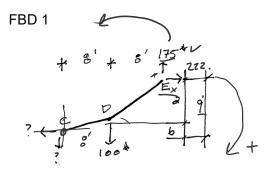

Cables Forces

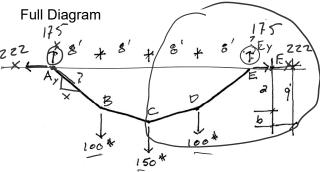

Example 1 even supports – symmetric loading

Systems with supports on the same level can be solved without simultaneous equations since the horizontal reactions pass through the same point.

If the system is symmetric then the end reactions will be equal, and can be solved by summing vertical forces.

Using a FBD of cut section and summing moments at a point with know dimensions (in this case C) the horizontal forces can be found.

$$\frac{\sum F_{v}=0 = +A_{v} - 100^{*} - 150^{*} - 100^{*} + E_{y}}{A_{y}+E_{y} = \frac{350^{*}}{A_{y}}}$$

$$\frac{A_{y}+E_{y}}{A_{y}} = \frac{350^{*}}{A_{y}}$$

FBD 1 $\sum_{A} MeC = 0 = 100(8') - 175^{*}(16') + E_{\times}(9')$ $E_{\times}(9') = 2000' - *$ $E_{\times} = 222.2^{*}$ $\sum_{A} F_{H} = 0 = -A_{\times} + E_{\times} = 0$ $A_{\times} = E_{\times} = 222.2^{*}$

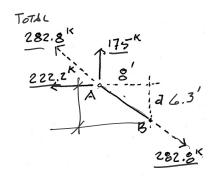

Cables Forces

Example 1

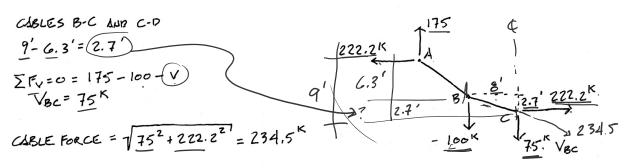

even supports - symmetric loading

Cable slopes and forces can now be found by ratios and Pythagorean formula.

CABLE A-B AND D-E
$$\frac{y}{x} \frac{175}{222.2} \cdot \frac{3}{8} \cdot \frac{3}{2} = \frac{6.3}{282.2}$$
CABLE FORCE = $\sqrt{175^2 + 222.2^2} = 282.8^*$

FBD 2

University of Michigan, TCAUP

Structures I

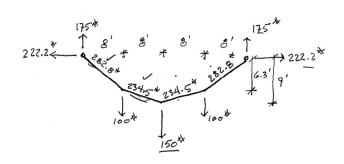

Slide 7 of 21

Cables Forces

Example 1

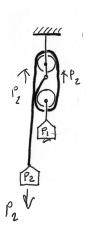

even supports - symmetric loading

Cable slopes and forces can now be found by ratios and Pythagorean formula.

Note that the forces in each length are different.

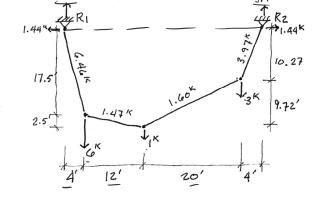

This type of system should not be confused with cable systems using pulleys, where the force remains the same throughout the length of the cable.

Solving Cables Forces

even supports – asymmetric loading Procedure:

- 1. Solve all external forces (reactions)
- If asymmetric, then the vertical reactions are not equal.
- With no applied horizontal loads, the horizontal reactions are equal.
- The vertical reactions can be solved either by summing moments at each end or by proportions as in a beam.
- The moment is also 0 at any point in the cable since the cable cannot support flexure,

- 2. Start at reactions and move inward
- Draw FBD of system from reaction inward
- · Slope is proportional to forces
- Use force equations to solve internal cable force at each cut point
- · Find forces and slope of each section

$$\sum Fx = 0$$
$$\sum Fy = 0$$

University of Michigan, TCAUP

Structures I

Slide 9 of 21

Cables Forces

Example 2 even supports – asymmetric loading

Systems with supports on the same level can be solved without simultaneous equations since the horizontal reactions pass through the same point.

If the system is asymmetric then summing moments about one reaction will give the vertical component of the other reaction.

To find the horizontal reaction component, cut a FBD at a point of known location (both x and y). So summing moments at C then finds the horizontal force.

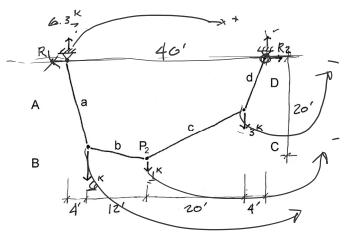

The horizontal force.
$$|\vec{r}_{d}| = \sqrt{6.3^{2} + 1.44^{2}} = 6.46^{K} \text{ T}$$

$$|\vec{r}_{d}| = \sqrt{3.7^{2} + 1.44^{2}} = 3.97^{K} \text{ T}$$

Slide 11 of 21

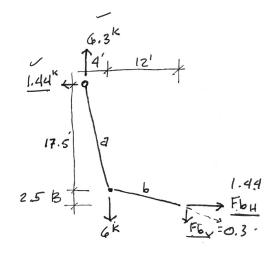

Cables Forces

Example 2 even supports – asymmetric loading

Proceed working inward from the reactions by cutting a FBD just before the end of the next section.

Because the force is in the same axis as the cable and there is no flexure in the cable, the ratio of the force components is proportional to the slope of the cable.

FIND B
$$0.3 : B B = 2.5'$$

$$\sum F_{Y} = 0 = 6.3^{K} - 6^{K} - F_{by}$$

$$F_{by} = 0.3^{K}$$

$$\sum F_{H} = 0 = -1.44^{K} + F_{bH}$$

$$-F_{bH} = 1.44^{K}$$

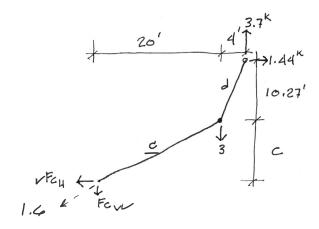

$$F_{b} = \sqrt{0.3^{2} + 1.44^{2}} = 1.47^{K} + T_{bH}$$

Cables Forces

Example 2 even supports – asymmetric loading

Proceed working inward from the reactions by cutting a FBD just before the end of the next section.

Because the force is in the same axis as the cable and there is no flexure in the cable, the ratio of the force components is proportional to the slope of the cable.

$$\frac{0.7}{1.44} : \frac{C}{20}, \quad C = \frac{9.72}{1.44}$$

$$\sum F_{V} = 0 = 3.7^{K} - 3^{K} - F_{CV}$$

$$F_{CV} = 0.7^{K}$$

$$\sum F_{H} = 0 = 1.44^{K} - F_{CH}$$

$$F_{CH} = 1.44^{K} \rightarrow$$

$$F_{C} = \sqrt{0.7^{2} + 1.44^{2}} = 1.60^{K} T$$

Structures I

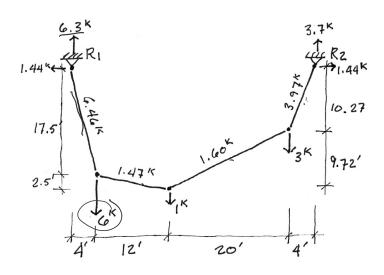

Slide 13 of 21

Cables Forces

Example 2

even supports - asymmetric loading

The final diagram compares the tension in each of the cable segments. Because of the asymmetry of the loading, the forces are also asymmetric. Note also that they generally increase toward the reactions.

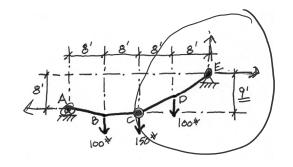

Cables Forces

Example 3 uneven supports

The analysis of a cable system is made by cutting a series of FBDs joint by joint. Each joint is analyzed as a concentric force system. All forces must sum to zero.

$$\sum Fx = 0 \quad \sum Fy = 0 \quad \sum M = 0$$

To define the shape, the end points and one other point are needed.

The procedure usually begins with the summation of moments to determine the end reactions.

Since the location of point C is known, a FBD is cut at C of the right side.
Summing moments at C will give a second equation for Ex and Ey.

$$EM@A = 0$$
 $loo^*(8') + 150^*(16') + loo^*(24') - \underline{E_Y}(32') + \underline{E_X}(8') = 0$
 $E_Y(32') = E_X(8') + 5600^{*-1}$
 $\underline{E_Y} = E_X(0.25') + 175^{*-1}$

$$\Sigma Me C = 0$$

 $100^*(8') - E_Y(16') + E_X(9') = 0$
 $E_Y(16') = E_X(9') + 800^{*-1}$
 $E_Y = E_X(0.5625') + 50^{*-1}$

University of Michigan, TCAUP

Structures I

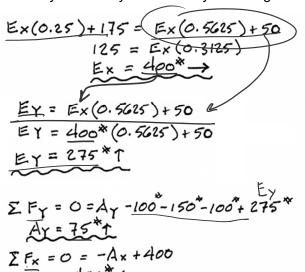

Slide 15 of 21

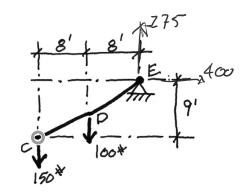

Cables Forces - uneven supports Example 3

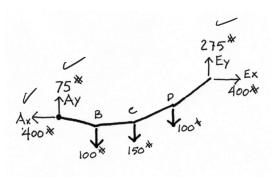

Setting the two equations equal to Ey, the value is found for Ex.

Then using Ex, Ey can be solved.

Finally Ax and Ay are found by summing forces.

Cables Forces: Ex. 3 - uneven supports

Working from the reactions inward, the slope of each segment is determined by the components of the force. The remaining forces can be found using the FBD of the joint..

FBD1 FBD2
$$\frac{400}{75} : \frac{8}{y_1}$$
 $y_1 = \underline{1.5}$ $\frac{400}{275} : \frac{8}{y_2}$ $y_2 = 5.5$

FBD3

points B and C are both known. Slope = $\frac{0.5}{8}$

$$\sum Fy = 0 = 75 - 100 + Tbcy$$
 $Tbcy = 25#$

$$\sum Fx = 0 = -400 + Tbcx \quad Tbcx = \underline{400} \#$$

FBD4

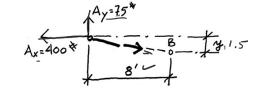

points C and D are both known. Slope = $\frac{3.5}{8}$

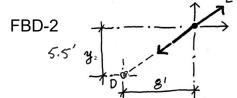

$$\sum Fy = 0 = 275 - 100 - Tdey$$
 $Tdey = 175#$

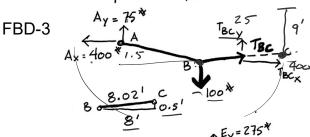

$$\sum \underline{F_x} = 0 = 400 - Tdex \quad Tdex = 400 \#$$

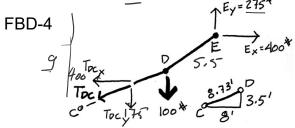

University of Michigan, TCAUP

FBD-1

Slide 17 of 21

Cables Forces — uneven supports Example 3

Using FBDs of each joint in turn the force components and slopes can be determined.

Cable forces are found by adding the components with Pythagorean formula.

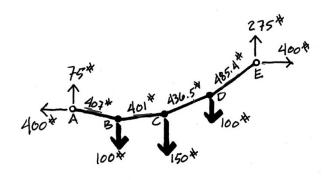

In summary the cable forces are:

Tab =
$$407.0 \#$$

Tbc =
$$400.8 \#$$

$$Tcd = 436.5 #$$

Tde = 485.4 #
